

Track SSL pre-training of the route encoder: what is hidden and what comes back

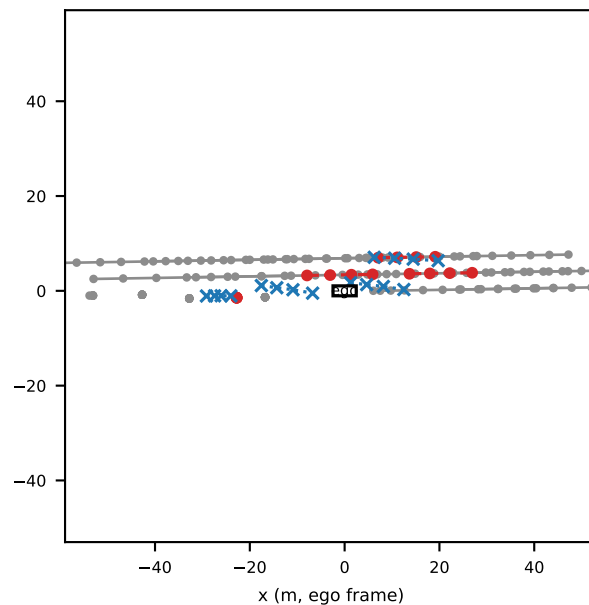

draw 0, seed 0, inner-validation windows at the selected epoch. Row 1: agent tracks in the ego frame; grey = the steps the encoder sees, red dashed = the hidden 2 s segment, blue dotted = its reconstruction. Row 2: the two most mobile masked agents as $x(t)$, the hidden interval shaded.

3419 hidden (agent, step) cells over 260 windows: RMSE 4.6 m in x , 2.5 m in y , 1.46 m/s in speed (98% / 97% / 83% of the variance).

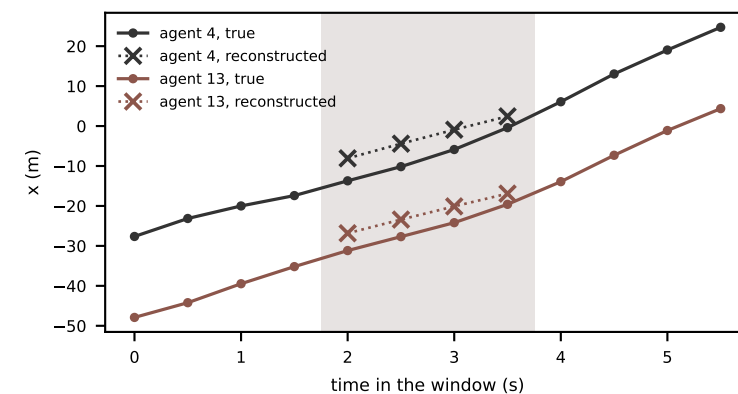

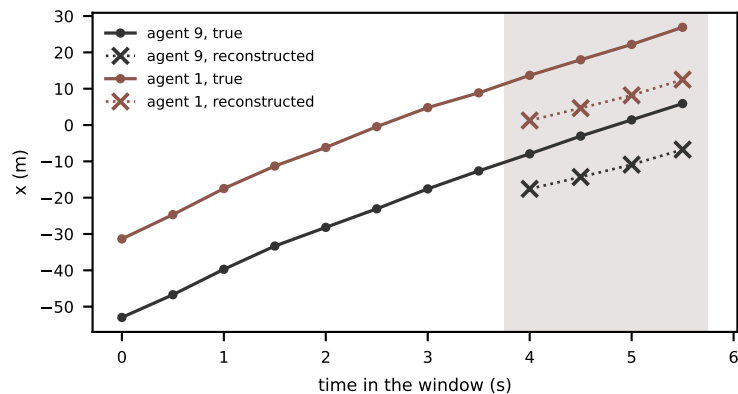

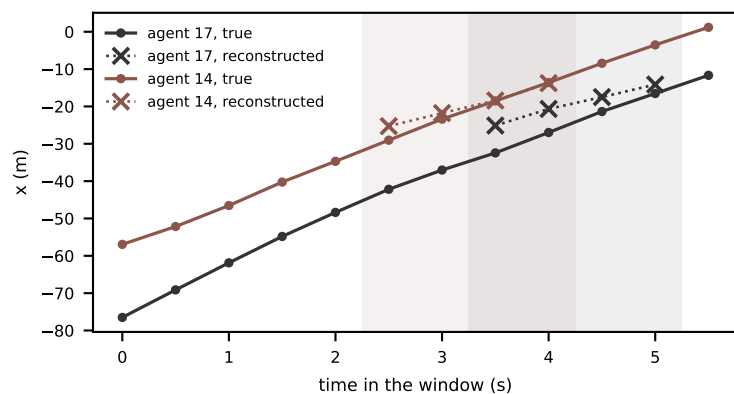

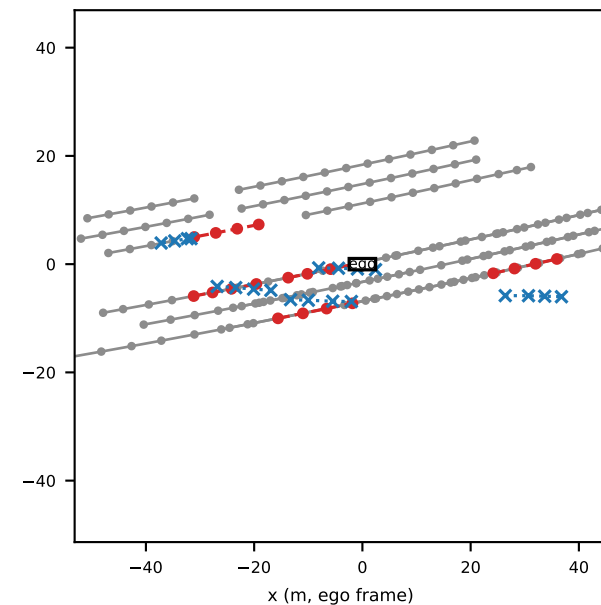

window 35: 6 of 16 agents masked

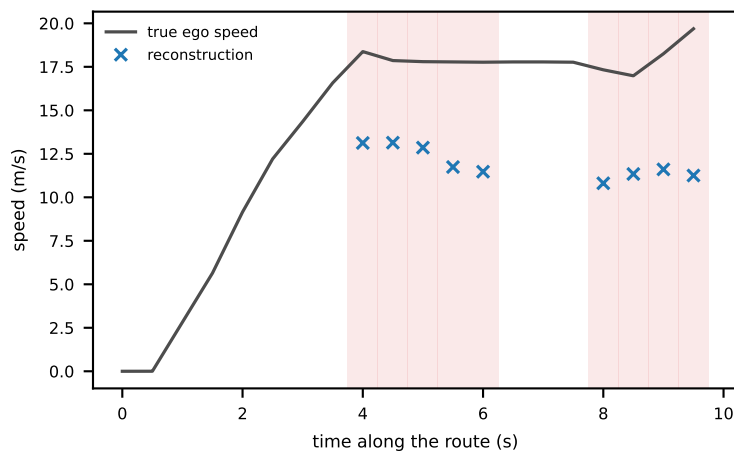

window 11: 4 of 14 agents masked

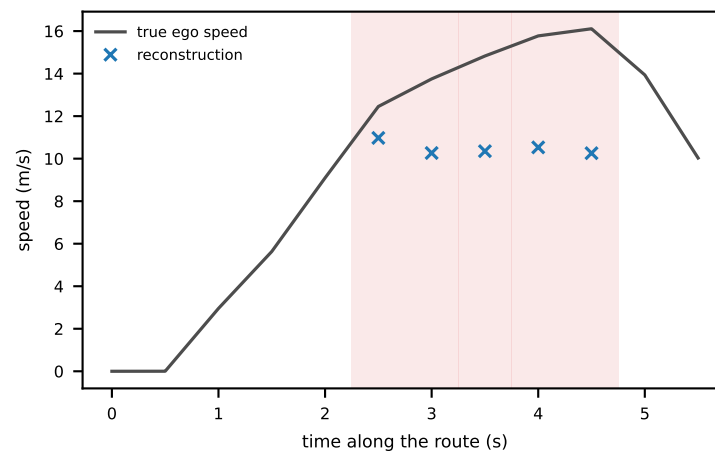

window 23: 5 of 16 agents masked

ego half, route 50: 9 of 20 steps hidden

ego half, route 53: 5 of 12 steps hidden

reconstruction error and the selected epoch (dashed)
